

Hanger wire bending tool

Item number WC1528-01

Material and weight

Weight: 6.330 kg

Function

In the overhead contact lines construction all hanger wires are fixed on both ends by means of

bended eyelets, if they are slanted pendulums for trolleybus or tramway overhead contact lines or hanger wires for railways contact lines. With the help of a hanger wire bending tool the eyelets not only become a constant shape but also the required eyelet distance (hanger or pendulum length) can be kept precise.
